03

Cretan land has been famous for its fertility and unique quality since ancient times. Minoans were the very first civilization during the times of which agriculture and livestock breeding met enormous prosperity. **EN ALOE™** is a natural juice with non-processed raw Aloe vera gel of organic agriculture, directly from Crete island.

Aloe vera juice contains more than 200 bioactive molecules, with vitamins, trace elements, amino acids, polysaccharides, and enzymes among others. Their combined and balanced action promotes the normal function of the intestine, the boost of the digestive system, and the immune response of the body. Moreover, enzymes separate carbohydrates, leading to good digestion. They facilitate fat rupture and absorption and wash out triglycerides from the fat tissue's capillary vessels.

Briefly:

- **Digestive Fortification:** Aloe vera juice may help against burning feelings and other digestive system's disorders.
- **Laxative Action:** O Aloe vera juice is rich in anthraquinone glycosides that possess natural laxative properties and support the motility of the intestine. Furthermore, it increases mucus production at the large intestine and gut motility that contributes to the food rupture.

EN ALOE™ features 100% organic stevia as a natural sweetener and lemon essence that provides a sense of freshness that fits perfectly to the original natural taste of Cretan Aloe vera. Enjoy daily an innovative formulation with a remarkable nutrient value and great taste.

The production process of **EN ALOE™** is certified by the **International Food Safety Standard ISO 22000: 2005 (HACCP)**, the **IFS Food Safety and Management Standard**, as well as the European Standards for the production of organic products.

Daily monitoring of Aloe vera crops

Experienced agronomists, daily monitor the crops of the cooperating farmers and provide all the necessary instructions for the proper and biological growth of the plants. Leaf samples are collected and sent to our laboratory, where specialized chemists determine the degree of maturity of the leaves and their concentration in nutrients. When the nutrient concentration is at the highest level, at this point in cooperation with our agronomists our farmers cut the leaves and transport them to our factory.

Leaf harvesting and transportation to our factory

The purpose of the process is to harvest the leaves without any loss or damage to their precious ingredients and quickly transfer them to the factory to avoid losing freshness. The leaves are harvested by qualified personnel, always under the supervision of the agronomists of the company.

Gel processing and separation

Leaves are taken to the plant within six (6) hours of harvesting and the process of processing is immediately initiated. They are firstly washed thoroughly and then propelled into special machines where the gel is removed from the inside of the leaf, without in any case grinding the entire leaf. This way, the high-quality gel is obtained without the need to use chemicals to filter the fresh aloe gel.

Bottling of Aloe vera nutrient supplements

Then follows the homogenization process of the Aloe vera gel and bottling in glass bottles.

en aloe™

This process starts with the careful screening of organic Aloe vera leaves continue with the process of extracting and stabilizing fresh Aloe vera gel - **ensuring the world's best quality of Aloe vera (99.1%)** - and completes by direct bottling of the product into glass sterile bottles, within a few hours to secure the freshest Cretan organic Aloe vera that is currently on the market.

09

Barbadensis Miller

EN ALOE™ is derived from biological cultivation, without the need to use hazardous pesticides and fertilizers. In this way, it contributes to the protection of the environment, as it has reduced the need for water and organic fertilizers.

Aloe vera barbadensis Miller can co-exist with harvest domestic animals, such as sheep and turkeys, to remove unwanted and harmful weeds from the plantation. The plantation doesn't have serious enemies except for the snail, which is treated in a biological way.

An important role for the growth of the plant plays the microclimate of the Crete island where it is grown, particularly in areas with mild winter (temperatures above 6 degrees Celsius) and in well-drained soils.

Organic aloe agriculture's purpose is the production of high-quality leaves, with no dangerous pesticides residues. These leaves are the raw material for the production of high organic value formulation.
